

SCM-200-Panasonic

Panasonic RS-485 Camera Control Two Input Code Merger

Merges data from two Panasonic RS-485 camera control sources into a single data line.

Each input and output baud rate is individually selectable.

Input #2 camera addresses can be offset in groups of 8 up to a maximum of 96.

SPECIFICATIONS

Size:	4.5" x 3.5" x 1.25"
Weight:	0.5 lb
Power:	9Volt to 15Volt AC or DC at 75ma
Environmental:	Indoor use only

NOTES

Input #2 Address Offset

Switches 1, 2, 3, and 4, when turned on, add 8, 16, 32, and 64, respectively to the camera address on input number 2. The maximum permitted offset is 88; if set higher, the Error led will light until the setting is corrected. The maximum camera output address is 96. If the resulting address exceeds 96, the Error led will blink and there will be no output.

This can be used for applications with multiple DVRs or Matrix system which have camera control outputs for camera addresses 1~8.

Here are some possible combinations.

System configuration

The code translator operates only in simplex mode, it does not handle response data. The control system and the cameras should be configured for 4 wire operation so they will not be responding on the same data lines as they are receiving.

If the control system can be configured for simplex operation it won't require a response from the camera. If it does require a response, the response lines from the camera should be connected directly back to the controller, not to the code merger.
